WV	Ruth Thornton	The Nature Conservancy

2 Use of the Northeast Connectivity Assessment Tool

The NCAT can be used to run custom ranking analyses at varying scales, with custom metric weights, and with various filters applied to the results. It is distributed pre-loaded with all dams and metrics that were evaluated in the analysis and the metric weights that were chosen by the project team for the anadromous fish scenario. This section describes the hardware, software, and methods necessary to successfully run a custom analysis with the NCAT.

2.1 Hardware and Software

The NCAT is designed for use in Microsoft Excel 2007. Its native environment is MS Windows XP, but it can be run on any platform that supports Excel 2007 or higher, including Windows Vista, Windows 7, and Mac OS X. Several of the NCAT's processing steps involve ranking functions which are computationally expensive operations. Thus, the speed at which the NCAT will perform an analysis is directly related to the hardware on which it is run. Excel 2007 has the ability to utilize multiple processors, so dual core machines will perform analyses faster than single core machines. Processor speed, available memory, and the computer resources consumed by other running programs will all affect the NCAT's performance.

2.2 Prior to running an NCAT analysis

2.2.1 Setting Calculation to Manual

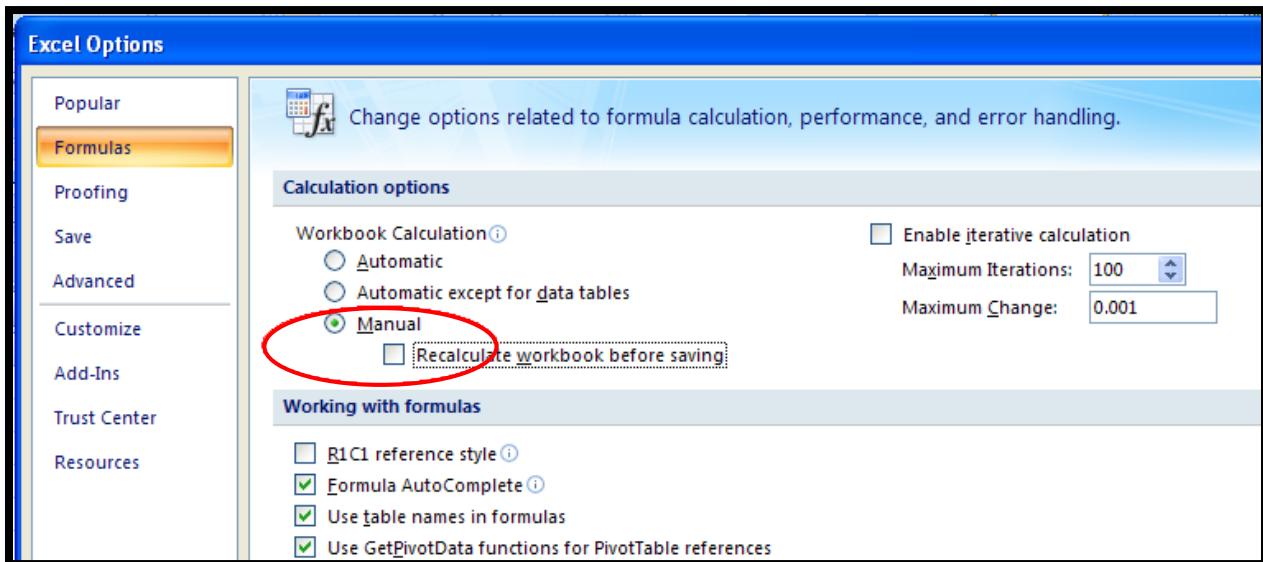

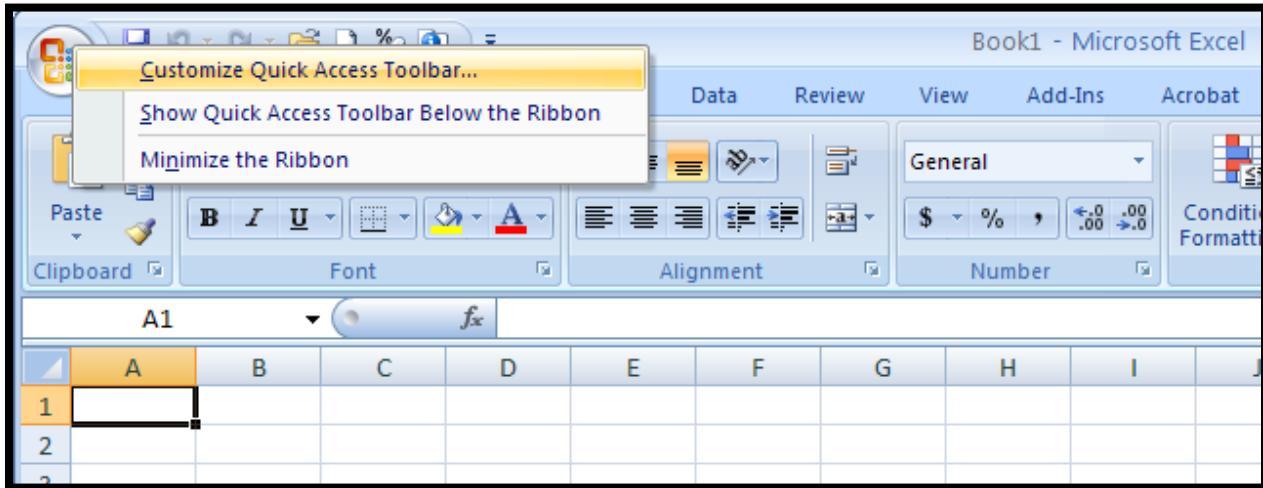

Before the NCAT is opened in Excel, it is important to set formula calculation to "manual". If left in the default "Automatic" mode, Excel will attempt to recalculate the entire workbook every time the NCAT is opened or a change is made. By setting the calculation mode to "manual", the NCAT is set to run only after all changes are made and the user executes the calculation.

The simplest way to do this is to follows, and is illustrated in Figure A1.

1. Open a new, blank Excel spreadsheet.
2. Right click on the Office button in the upper left corner of the spreadsheet
3. Select "Customize Quick Access Toolbar"
4. Select the "Formulas" tab on the left
5. Set "Workbook Calculation" to Manual
6. Unselect "Recalculate workbook before saving"
7. Click OK
8. Open NCAT

If the NCAT is opened and Excel begins automatic calculation, the calculation can be interrupted by clicking repeatedly in a cell. This method of interrupting the calculation, however, is not as reliable as setting the workbook to "manual calculation" in the beginning.

Figure A1: Setting up Excel prior to opening the NCAT

2.2.2 Accepting Macros

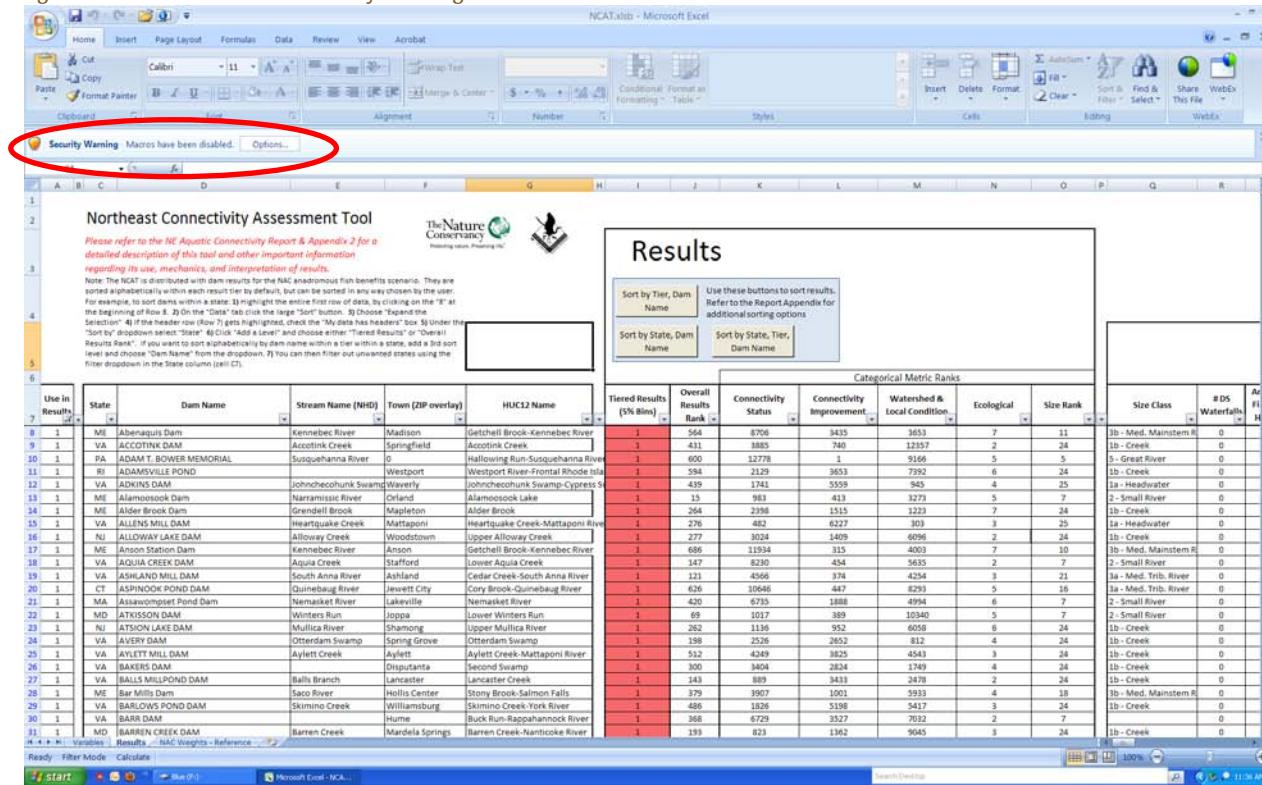

Some functionality in the NCAT relies on Visual Basic macros. Thus, when the NCAT is opened, the following warning in Figure A2 may be displayed, due to the potential misuse of macros and the resulting security concern. "Enable Macros" to enable full functionality. If you are concerned about the potential security risk posed by macros in general, refer to Appendix Section 2.5 for guidance on achieving the functionality provided by macros manually.

Figure A2: Security warning when NCAT is opened. Select "Enable Macros"

Depending on your software versions and settings, you may see the following banner (Figure A3) at the top of the excel Window. Selecting the "Options" button will bring up a dialog box to enable the content.

Figure A3: Alternate Macro security warning location

For more information on macros, macro security, and how set your Excel options to allow macros please refer to the Microsoft help website: <http://office.microsoft.com/en-us/excel-help/change-macro-security-settings-in-excel-HP010096919.aspx>.

2.3 Preparing a custom analysis

With the NCAT open and set to manual calculation mode, the custom analysis may begin. Two primary facets of the NCAT are available for customization: the relative weights for each of the metrics and the spatial scale of the analysis.

2.3.1 Custom weight scenario

Metric weights used in the NCAT are relative weights. That is, the weights assign the importance of each metric relative to the other metrics for a given scenario (e.g. anadromous fish). Thus, the sum of all weights must equal 100. If there was interest in running an analysis utilizing a single metric, a weight of 100 would be given to that metric. For example, if a weight of 100 were applied to the “Length of Functional Upstream Network” metric, the dam with the largest functional upstream network would be first in the results. Note that the number of metrics used in an analysis will have an effect on the processing time of the NCAT; additional metrics will slow the processing.

Metric weights are entered on the “Variables” worksheet in the NCAT. The NCAT comes pre-loaded with the anadromous fish scenario weights chosen by the project team in the “Variables” worksheet . (Additionally, resident fish scenario weights are included for reference on the “NEAFWA Weights” worksheet, but these are not “live” weights, simply a static list of the resident weights for reference.) The steps to make changes to metric weights are as follows:

1. Enter the desired weights on the “Variables” worksheet in the NCAT
2. Select the “Formula” tab at the top of the workbook (Figure A4)
3. Press the “Calculate sheet” button (or press Shift+F9) to ensure that the entered metric weights sum to 100. The "Calculate Sheet" option does not calculate all formulas in the entire workbook

Figure A4: Entering custom weights and calculating the sheet to confirm weights sum to 100

The screenshot shows a Microsoft Excel spreadsheet titled "NCAT_xlsb - Microsoft Excel". The "Formulas" tab is selected, indicated by a red circle around the tab name. In the "Calculation Options" group on the ribbon, the "Calculate Sheet" button is also circled in red. The main table on the worksheet has a column labeled "Size Metrics" on the left. The data rows include various network metrics like "Upstream Network Miles in Small Rivers" through "Great Rivers", "Total Reconnected Network Miles in Headwaters", and "Total Reconnected Network Miles in Great Rivers". The last row is a subtotal for "Size Metric Subtotal" with a value of 7. Below this is a row labeled "Sum of Weights (MUST =100)" containing the value 100, which is also circled in red.

Size Metrics	D	E	F	G	I	J
Upstream Network Miles in Small Rivers		0				
Upstream Network Miles in Medium Tributary Rivers		0				
Upstream Network Miles in Medium Mainstem Rivers		0				
Upstream Network Miles in Large Rivers		0				
Upstream Network Miles in Great Rivers		0				
Total Reconnected # stream sizes (upstream + downstream) >0.5 Mile		0				
Total Reconnected Network Miles in Headwaters		0				
Total Reconnected Network Miles in Creeks		0				
Total Reconnected Network Miles in Small Rivers		0				
Total Reconnected Network Miles in Medium Tributary Rivers		0				
Total Reconnected Network Miles in Medium Mainstem Rivers		0				
Total Reconnected Network Miles in Large Rivers		0				
Total Reconnected Network Miles in Great Rivers		0				
Size Metric Subtotal		7				
Sum of Weights (MUST =100)		100				

2.3.2 Custom spatial scale

A custom spatial scale can be applied so that only dams within a region of interest are included in the analysis. This scale can be set to a given state or watershed (HUC4, HUC6, HUC8, HUC10, HUC12). The HUC10 or HUC12 name may also be used, but the name must match exactly as it is stored in the NHD database. (HUCs which begin with a '0' must include the '0'). The scale is entered below the weights table on the "Variables" worksheet (cell F96). If this cell is left blank, the entire region will be included in the analysis. Note that the entire region will take longer to calculate than a scale which includes fewer dams.

Note: If a custom spatial scale is used in an analysis, it is important to ensure that the default filter which excludes results outside of the area of interest is applied on the results worksheet. Otherwise, the results, while correct, will contain many rows with no values. This is done by applying a filter which excludes "0" from the "Use" column in the results. Additional details on how to apply this filter are found in Section 2.5.3.

2.3.3 Other options

Categorical ranks break out each dam's standing with each of the five metric categories (Connectivity Status, Connectivity Improvement, Watershed and Local Condition, Ecological, and Size). These ranks can be helpful for determining what metrics are driving the overall results, but they slow the calculation

process. Enter "Yes" in the calculate categorical ranks option cell, F100, if you would like to calculate categorical ranks. If not, leave the cell blank.

2.4 Executing a custom analysis calculation

When all options and variables are set, the NCAT is ready to be re-calculated. Click on the "Formulas" tab and locate the "Calculate Now" button in the upper-right hand corner (Figure A4). After confirming that all variables are set as desired , click on the "Calculate Now" button. Once this button is pressed, it is critical that no cells or edged of the Excel window be clicked on-- doing so can interrupt the calculation, thus necessitating re-running the calculation.

The time required to run the analysis will considerably based on the hardware specifications of the computer, the other processes that are running concurrently on the computer, and the variables selected for the analysis. Larger geographic extents (states or watersheds) run slower than small ones, as do running the categorical ranks. An analysis of a small state or watershed (~500 dams) without categorical ranks on a computer with a dual core 2.4GHz processor and 2GB of RAM will run in about the time it takes to grab a cup of coffee. The entire region with categorical ranks will run on the same machine overnight. A small state or watershed will run on a quad core 3.3 GHz processor with 8 GB of RAM in a minute or less and will run the entire region with categorical ranks in about two hours.

The status of the calculation is displayed in the lower right-hand corner of the Excel window (Figure A5). Note that this figure is a percentage of the individual operations run, not a percentage of time required to run the entire analysis. Thus, it is possible for the last percentage to take longer than the first 75%.

Figure A5: Executing the calculation

The screenshot shows the Microsoft Excel interface with the 'Results' worksheet active. The ribbon is visible at the top, with the 'Formulas' tab selected. The main area contains several data tables:

- Size Metrics** (Rows 76-89):

	C	D	E
Upstream Network Miles in Small Rivers		0	
Upstream Network Miles in Medium Tributary Rivers		0	
Upstream Network Miles in Medium Mainstem Rivers		0	
Upstream Network Miles in Large Rivers		0	
Upstream Network Miles in Great Rivers		0	
Total Reconnected # stream sizes (upstream + downstream) >0.5 Mile		5	
Total Reconnected Network Miles in Headwaters		0	
Total Reconnected Network Miles in Creeks		0	
Total Reconnected Network Miles in Small Rivers		0	
Total Reconnected Network Miles in Medium Tributary Rivers		0	
Total Reconnected Network Miles in Medium Mainstem Rivers		0	
Total Reconnected Network Miles in Large Rivers		0	
Total Reconnected Network Miles in Great Rivers		0	
Size Metric Subtotal		12	
- Sum of Weights (MUST =100)** (Row 91): Value 100
- Scale of Interest** (Row 95):

Enter one of the following: HUC 2, 4, 6, 8, 10, or 12 code, HUC10 name*, or 2-letter state abbreviation. If the box is left blank, the entire region will be ranked.	
--	--

*If used, HUC 10 name must match exactly as it is stored in the database(not case sensitive)
- Calculate categorical ranks? (slows calculation). Enter "Yes" or leave blank** (Row 450): Value Yes

At the bottom of the screen, the status bar shows 'Calculating: (8 Processor(s)): 79%'.

2.5 Manipulating results

Results are output from the NCAT onto the “Results” worksheet in the NCAT workbook. Two buttons are provided to sort the results using three predetermined sort orders (*macros must be enabled for the button functionality to work*):

1. By state, then by dam name
2. By result tier, then by dam name
3. By state, tier, then by dam name

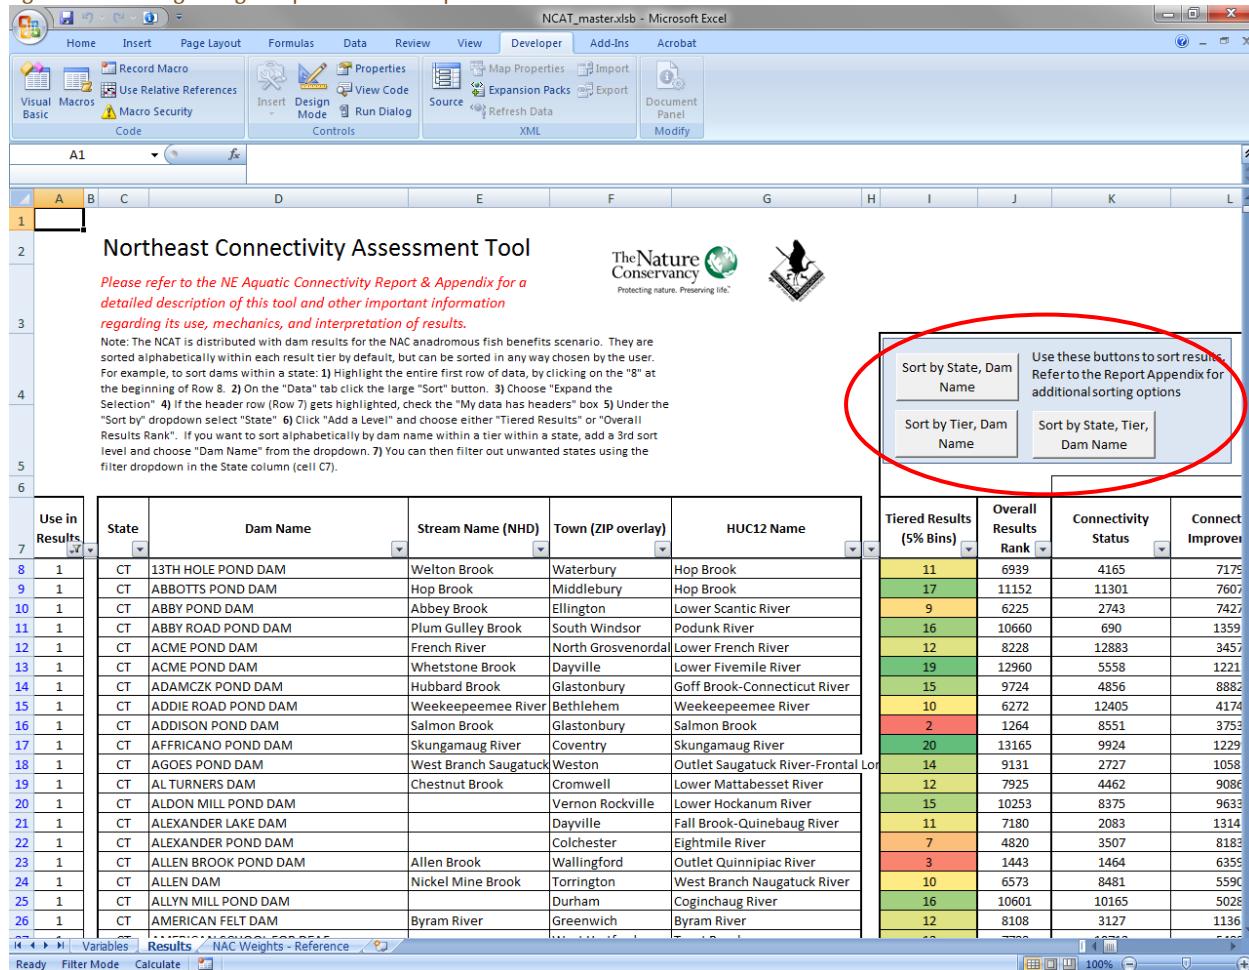

Other basic sorting and filtering of results can be also performed on this Results worksheet. It is important to note that the results presented on this worksheet are linked to other worksheets in the NCAT, which are hidden by default. ***Thus, to help avoid potential problems, several intermediate worksheets are hidden from the user and the Results worksheet is protected to avoid accidental corruption of the tool.*** The Sections below detail how to "unprotect" this worksheet and access the full sorting functionality. To further avoid potential problems, results can be copied into a new, blank Excel workbook and manipulated without concern of worksheet protection potentially corrupting the tool.

Additionally, copying the results into a new worksheet is necessary if results are to be joined back to a GIS. The steps for copying the results to a new worksheet are described in Appendix Section 2.5.4.

2.5.1 Re-applying the default filtering and sorting

After a new analysis is run in the NCAT, the sorting of the results will no longer be current. Three sorting options are prepared for the user as buttons, as shown in Figure A6 (macros must be enabled for this functionality to work).

Figure A6: Sorting using the provided sort options.

It is important to note that if a custom spatial scale was applied to the analysis, blank rows may be present in the results. There is a filter to exclude these. Simply select the dropdown arrow in Cell A7 (the "Use in Results" column) and uncheck the "0" value. This is one of the default sorting parameters, but may need to be reapplied following custom analyses.

2.5.2 Unprotecting the Results worksheet

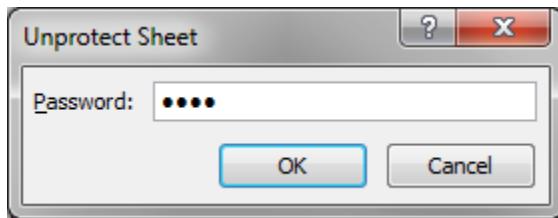

Results can be sorted and filtered in many ways using Excel's native functionality, beyond the three options provided by the sorting buttons. In order to perform custom sorts, the Worksheet must first be unprotected. This is done by selecting the "Unprotect sheet" button on the "Review" tab (Figure A7). ***Once this Worksheet is unprotected, it is possible to edit the formulas which underlay the NCAT and corrupt the results. Thus, it is important to follow the directions below carefully to avoid potential problems.***

Figure A7: Unprotecting the Results worksheet prior to custom sorting.

The screenshot shows a Microsoft Excel window titled "NCAT_master.xlsx - Microsoft Excel". The "Review" tab is selected in the ribbon. On the far right of the ribbon, there is a "Protect and Share Workbook" group containing buttons for "Protect Workbook", "Share Workbook", and "Allow Users to Edit Ranges". Below the ribbon, the "Comments" tab is active, showing various comment-related buttons. The main worksheet is titled "Northeast Connectivity Assessment Tool". It contains a header section with logos for The Nature Conservancy and the U.S. Fish and Wildlife Service. Below the header is a detailed note about sorting the data. The main table has columns for "Use in Results", "State", "Dam Name", "Stream Name (NHD)", "Town (ZIP overlay)", and "HUC12 Name". The "Tiered Results (% Bins)" column is sorted by rank, with values ranging from 1 to 20. The "Overall Results Rank" column is also sorted by rank, with values ranging from 1 to 13. The "Connectivity Status" and "Conn Improv" columns are currently empty. At the bottom of the screen, the status bar shows "Ready 13835 of 13836 records found Calculate 100%".

A dialog box will appear asking for a password to unprotect the sheet. The password is "fish" (no quotes).

Figure A8: Password dialog box to "unprotect" the Results worksheet.

Note: The worksheet will be protected again if the sorting buttons are used to sort results after the worksheet is unprotected.

2.5.3 Manually Sorting the Results

Critical when sorting data is to confirm that all of the columns of interest are highlighted prior to performing the sort. If not all of the data are highlighted, some of the columns may not sort, in which case the rows (dams) will no longer correctly report all of their associated data. The steps to correctly sort data are as follows (Figure A9):

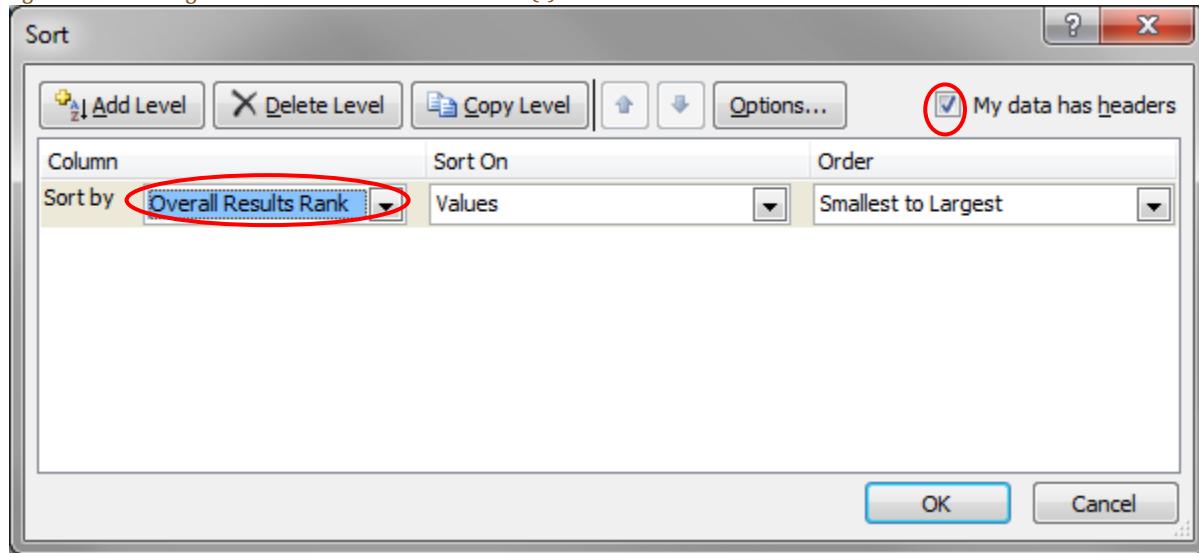

1. Highlight the entire first row of data (i.e. Row 8, below the column names). If the entire row is not selected, columns that are to the right of any blank columns may not sort.
2. Click on the “Data” tab at the top of the Excel window
3. Click on the large “Sort” button in the “Sort & Filter” section of the Data ribbon
4. Select “Expand the Selection” This will select all of the active rows in the worksheet. Including a header row.

Figure A9: Sorting the results – Define the cells to sort

The screenshot shows a Microsoft Excel spreadsheet titled "NCAT_master.xlsb - Microsoft Excel". The ribbon menu is visible at the top, with the "Data" tab selected. In the "Data" tab, the "Sort & Filter" group is highlighted, showing the "Sort" icon with a circled "A" and "Z" icon. Below the ribbon, cell A8 contains the formula "=Weighted Ranks '!\$B602". The main content area displays a table titled "Northeast Connectivity Assessment Tool". The table has columns for "Use in Results", "State", "Dam Name", "JUCOM NAME (WRI)", "TOWN/LF OVERLY", and "RIVER NAME". A "Sort Warning" dialog box is overlaid on the table, asking if the user wants to expand the selection or continue with the current selection. The "Expand the selection" option is checked. To the right of the table, there is a sidebar with buttons for sorting by State, Dam Name, Tier, and Overall Results Rank. The data table contains 13835 rows of dam information.

5. In the “Sort” dialog box, check the “My data has headers” box. This will unselect the header row with column names. (Figure A10)
6. Select the column to sort by (e.g. “Rank”). Confirm that the “Sort On” option reads “Values” and the “Order” option reads “Smallest to Largest” (unless you want to look at the lowest ranked dams.)
7. Additional columns can be sorted on if desired by clicking “Add a Level” on the “Sort” dialog box. For example, this can allow you to sort dams alphabetically within a 5% tier.
8. Click OK.

Figure A10: Sorting the results – Choose the column(s) to sort on

2.5.4 Filtering the Results

Results can be filtered using data from any one of the columns. (*Note: the Results worksheet does NOT need to be Unprotected for the filtering functionality to work*). The filtering functionality can be used to exclude dams who don't meet a given criteria. For example, dams with existing fish passage facilities can be excluded from the results to identify high ranking dams that lack fish passage. Similarly, dams could be filtered on their primary purpose (e.g. exclude hydro power dams or flood control dams) or the size of the river (e.g. exclude dams on large rivers). The steps needed to filter the results are (Figure A11):

1. Confirm that filters are in place. If so, the header row will have drop-down arrows at each of the cells with a column name. NCAT is distributed with filtering in place, but subsequent analyses made remove the filtering, or the filtering may need to be refreshed.
2. To apply filters, select all the cells with column names.
3. On the “Data” tab, click the large “Filter” button. Drop down arrows will appear in each of the header cells.
4. Click on the drop down arrow for the column of interest. Uncheck values which you wish to exclude from the results.
5. Filters can be removed by either re-checking the box for the excluded results or by clicking the large “Filter” button to remove the filters all together.

Figure A11: Filtering results

The screenshot shows the Microsoft Excel ribbon with the "Data" tab selected. The "Filter" button in the "Sort & Filter" group is circled in red. The main worksheet displays the "Northeast Connectivity Assessment Tool". It includes a note about sorting, logos for The Nature Conservancy and USFWS, and a table of dam data. A sidebar on the right provides sorting options. The status bar at the bottom shows "Ready" and "13835 of 13836 records found".

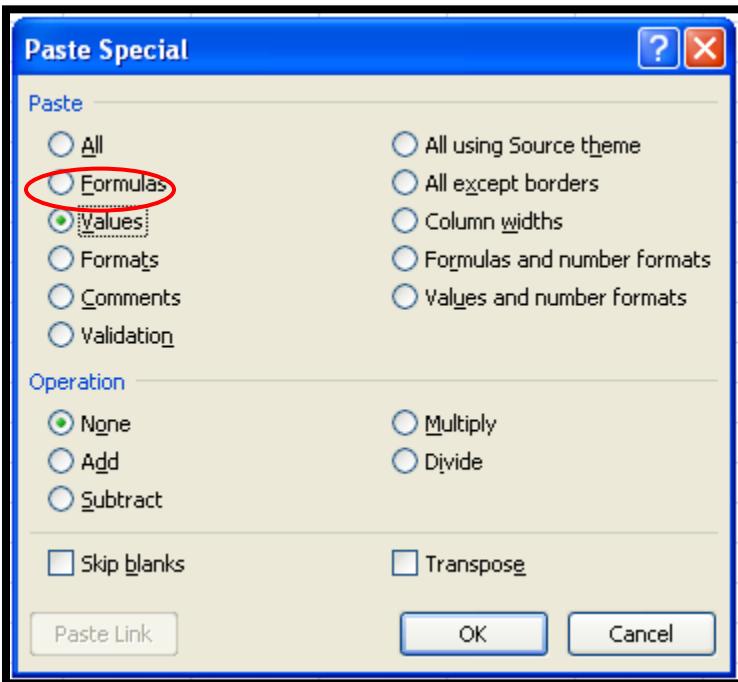

Use in Results	State	Dam Name	Stream Name (NHD)	Town (ZIP overlay)	HUC12 Name
23	CT	ALLEN BROOK POND DAM	Allen Brook	Wallingford	Outlet Quinnipiac River
24	CT	ALLEN DAM	Nickel Mine Brook	Torrington	West Branch Naugatuck River
25	CT	ALLYN MILL POND DAM		Durham	Coginchaug River
26	CT	AMERICAN FELT DAM	Byram River	Greenwich	Byram River
27	CT	AMERICAN SCHOOL FOR DEAF		West Hartford	Trout Brook
28	CT	AMERICAN THREAD DAM #1		Willimantic	Nelson Brook-Willimantic River
29	CT	AMERICAN THREAD DAM #2		Willimantic	Nelson Brook-Willimantic River
30	CT	AMERICAN THREAD DAM #3		Willimantic	Nelson Brook-Willimantic River
31	CT	AMERICAN THREAD DAM #4		Willimantic	Nelson Brook-Willimantic River
32	CT	AMES BROOK DAM	Ames Brook	Chaplin	Sawmill Brook-Natchaug River
33	CT	AMOS LAKE DAM		Preston	Poquetau Brook
34	CT	ANDERSON POND DAM		Lakeville	Salmon Creek
35	CT	ANDERSON ROAD DAM	Skungamaug River	Tolland	Skungamaug River
36	CT	ANDREW POND DAM	Farmill River	Shelton	Farmill River
37	CT	ANGULUS POND DAM	Byram River	Greenwich	Byram River
38	CT	ANGUS PARK POND DAM	Roaring Brook	Glastonbury	Roaring Brook
39	CT	ANO COIL POND DAM	Hockanum River	Vernon Rockville	Upper Hockanum River
40	CT	AQUA POND DAM	Latimer Brook	Oakdale	Niantic River
41	CT	AQUA POND DAM	Snake Meadow Brook	Moosup	Lower Moosup River

2.5.5 Copying results to a blank workbook

Results can easily be copied into a new workbook using Excel's native copy and paste functionality. To do this:

1. Simply highlight all of the data and header rows of interest and press Control-C or right-click and select "Copy" to copy the data to the computer's clipboard
2. On a new blank worksheet, select a cell near the top left (e.g. call A1)
3. Right-click and select "Paste Special"
4. Select "Values" to paste the values of the cells (not the formulas which link to the NCAT) into the new spreadsheet. (Figure A12).

Figure A12: Pasting result values into a blank worksheet

The resulting data will have none of the formatting or formulas from the original results worksheet, only the values. This is a necessary step when joining the results to a GIS.

2.5.6 Joining results to GIS data

In order to be joined back to a GIS, results must be formatted as a simple table with no supplementary formatting (e.g. merged cells, filters, etc). This is best done by creating a new blank workbook and copying the results, as described above. In addition to these steps, column names are best formatted in a GIS-friendly manner: short name of no more than 10 characters with no spaces or special characters. Thus, the “Primary Purpose” column might be renamed “PrimPurp” and “# DS Waterfalls” be renamed “NumDSFalls.”

For full compatibility with a GIS, the worksheet should be saved as a dBase (.dbf) file. If using ArcGIS, this can be done by adding the worksheet to your map project, and exporting it as a dBase file. This process will also add a GIS-generated ObjectID, which is necessary to perform spatial selections in the GIS.

3 Dam review error flagging process

Dams were prioritized for manual review using an automated flagging process which highlighted dams with a high potential for having error introduced from the snapping process. The following fields were added to the dam dataset and values calculated for each dam. Next to each value is a definition of the value.

“PROBNAME” – A problem with the waterbody name.

‘1’ = waterbody name in the dam database does not match the waterbody name in the NHDPlus

‘2’ = no waterbody name in the dam database, so no comparison could be made

“PROBSZ1” – A large dam on a small stream

‘1’ = dam \geq 15ft high on small stream (size 1a or 1b; $<38.61 \text{ mile}^2$ watershed)

‘2’ = dam does not have size attribute so comparison cannot be made

“CHECK2UP” – Critical to make sure that all dams that snapped to larger rivers are correct, since errors will have a greater impact when the network analysis is run.

‘1’ = all dams that snapped to size 2+ rivers (watershed $\geq 38.61 \text{ mile}^2$)

‘2’ = dams that did not snap to the hydrography (100m) but are within 500m

“UNSNAPPED” – Indicates whether or not the dam snapped to the hydrography

‘1’ = dam did not snap to the hydrography using a 100m snap tolerance

“CHKDMSZ” – Review all large dams to ensure they are correctly snapped.

‘1’ = all dams with either height ≥ 40 or length ≥ 1500 or surface area ≥ 300

‘2’ = all dams with either height ≥ 25 or length ≥ 1000 or surface area ≥ 100

‘3’ = all dams with either height ≥ 15 or length ≥ 750 or surface area ≥ 50

“DISTNEIGHB” – Avoid counting a dam twice if it is a duplicate (e.g. state data and NID data) or two structures of the same dam. Calculated in GIS - Distance in meters to the closest neighboring dam

The flags calculated above were then combined into a new “PRIORITY” field which prioritized dams for review, using the following system:

“PRIORITY” =

‘1’ = Dams that snapped to a larger river (size 2+) and where the waterbody name between the two datasets does not match. Also all dams that are within 100m of their nearest neighbor. [“CHECK2UP” =1 AND “PROBNAME” in (1, 2) OR “DISTNEIGHB” ≤ 100]

‘2’ = Dams that are near larger rivers (size 2+) and didn’t snap, and/or don’t have matching waterbody names. [“CHECK2UP” = 2 AND “CHKDMSZ” >0 OR “CHECK2UP” = 2 AND “PROBNAME” >0]

‘3’ = Large dams that were not already checked in the above steps. [“CHKDMSZ” >0 AND “PRIORITY” =0]

'4' = Large dams on small streams that also have inconsistent waterbody names. [“PROBSZ1” = 1 AND “PROBNAME” = 1]

'5' = Remaining dams that snapped to smaller streams (size 1a and size 1b) and have waterbody name inconsistencies. [“PROBNAME” =1 AND “PRIORITYZE” =0]

'6' = The remaining unsnapped dams. Check for dams near rivers with matching waterbody names. [“UNSNAPPED” =1 and “PRIORITYZE” =0]

'7' = Remaining dams with nearest neighbors closer than 500m. [“DISTNEIGHB” <=500 AND “PRIORITYZE” =0]

5 Metric Calculation Python Scripts

The following Python scripts were exported from ArcGIS ModelBuilder (version 9.3.1). They were used to calculate those dam metrics that were not calculated using the Barrier Analysis Tool (see Table 4-1 for a complete list of metrics including those that were calculated using the BAT). *These scripts are not provided to enable users to run the analysis.* Rather, they are provided to illustrate, for an experienced GIS user, the detailed methodology that was used to calculate each metric. If a user is interested in replicating any of the processes described in these scripts, please contact the author for an electronic copy of the Python scripts or the ArcGIS toolbox with the models.

5.1 BAT Data Prep.py
